Chapter 26
Enhanced Data Models for Advanced Applications
Active Database Concepts and Triggers

Generalized Model for Active Databases and Oracle Triggers

- **Triggers** are executed when a specified condition occurs during insert/delete/update
  - Triggers are action that fire automatically based on these conditions
Event-Condition-Action (ECA) Model

Generalized Model (cont.)

- Triggers follow an Event-condition-action (ECA) model
  
  - **Event:**
    - Database modification
      - E.g., insert, delete, update,
  
  - **Condition:**
    - Any true/false expression
      - Optional: If no condition is specified then condition is always true
  
  - **Action:**
    - Sequence of SQL statements that will be automatically executed
Trigger Example

Generalized Model (cont.)

- When a new employee is added to a department, modify the Total_sal of the Department to include the new employee's salary
  - Logically this means that we will CREATE a TRIGGER, let us call the trigger Total_sal1
    - This trigger will execute AFTER INSERT ON Employee table
    - It will do the following FOR EACH ROW
      - WHEN NEW.Dno is NOT NULL
      - The trigger will UPDATE DEPARTMENT
      - By SETting the new Total_sal to be the sum of
        - old Total_sal and NEW. Salary
        - WHERE the Dno matches the NEW.Dno;
Example: Trigger Definition

CREATE TRIGGER Total_sal1
AFTER INSERT ON Employee
FOR EACH ROW
WHEN (NEW.Dno is NOT NULL)
UPDATE DEPARTMENT
SET Total_sal = Total_sal + NEW. Salary
WHERE Dno = NEW.Dno;
CREATE or ALTER TRIGGER

Generalized Model (cont.)

- **CREATE TRIGGER** `<name>`
  - Creates a trigger
- **ALTER TRIGGER** `<name>`
  - Alters a trigger (assuming one exists)
- **CREATE OR ALTER TRIGGER** `<name>`
  - Creates a trigger if one does not exist
  - Alters a trigger if one does exist
    - Works in both cases, whether a trigger exists or not
Conditions

Generalized Model (cont.)

- **AFTER**
  - Executes after the event

- **BEFORE**
  - Executes before the event

- **INSTEAD OF**
  - Executes *instead of* the event
    - Note that event does not execute in this case
    - E.g., used for modifying views
Row-Level versus Statement-level

Generalized Model (cont.)

- Triggers can be
  - **Row-level**
    - FOR EACH ROW specifies a row-level trigger
  - **Statement-level**
    - Default (when FOR EACH ROW is not specified)

- Row level triggers
  - Executed separately for each affected row

- Statement-level triggers
  - Execute once for the SQL statement,
Condition

Generalized Model (cont.)

- Any true/false condition to control whether a trigger is activated on not
  - Absence of condition means that the trigger will always execute for the even
  - Otherwise, condition is evaluated
    - before the event for BEFORE trigger
    - after the event for AFTER trigger
Action

Generalized Model (cont.)

- Action can be
  - One SQL statement
  - A sequence of SQL statements enclosed between a BEGIN and an END
- Action specifies the relevant modifications
Triggers on Views

Generalized Model (cont.)

- INSTEAD OF triggers are used to process view modifications
Active Database Concepts and Triggers

Design and Implementation Issues for Active Databases

- An active database allows users to make the following changes to triggers (rules)
  - Activate
  - Deactivate
  - Drop
Active Database Concepts and Triggers

Design and Implementation Issues for Active Databases

- An event can be considered in 3 ways
  - Immediate consideration
  - Deferred consideration
  - Detached consideration
Active Database Concepts and Triggers

Design and Implementation Issues (cont.)

- Immediate consideration
  - Part of the same transaction and can be one of the following depending on the situation
    - Before
    - After
    - Instead of
  
- Deferred consideration
  - Condition is evaluated at the end of the transaction

- Detached consideration
  - Condition is evaluated in a separate transaction
Active Database Concepts and Triggers

Potential Applications for Active Databases

- **Notification**
  - Automatic notification when certain condition occurs
  - Enforcing integrity constraints
    - Triggers are smarter and more powerful than constraints
- **Maintenance of derived data**
  - Automatically update derived data and avoid anomalies due to redundancy
    - E.g., trigger to update the Total_sal in the earlier example
Active Database Concepts and Triggers

Triggers in SQL-99

- Can alias variables inside the REFERENCING clause
Active Database Concepts and Triggers

- Trigger examples

**T1:** CREATE TRIGGER Total_sal1
AFTER UPDATE OF Salary ON EMPLOYEE
REFERENCING OLD ROW AS O, NEW ROW AS N
FOR EACH ROW
WHEN ( N.Dno IS NOT NULL )
UPDATE DEPARTMENT
SET Total_sal = Total_sal + N.salary - O.salary
WHERE Dno = N.Dno;

**T2:** CREATE TRIGGER Total_sal2
AFTER UPDATE OF Salary ON EMPLOYEE
REFERENCING OLD TABLE AS O, NEW TABLE AS N
FOR EACH STATEMENT
WHEN EXISTS ( SELECT * FROM N WHERE N.Dno IS NOT NULL ) OR
EXISTS ( SELECT * FROM O WHERE O.Dno IS NOT NULL )
UPDATE DEPARTMENT AS D
SET D.Total_sal = D.Total_sal
+ ( SELECT SUM (N.Salary) FROM N WHERE D.Dno=N.Dno )
- ( SELECT SUM (O.Salary) FROM O WHERE D.Dno=O.Dno )
WHERE Dno IN ( ( SELECT Dno FROM N ) UNION ( SELECT Dno FROM O ) )

---

**Figure 26.6**
Trigger T1 illustrating the syntax for defining triggers in SQL-99.
Temporal Database Concepts

Time Representation, Calendars, and Time Dimensions

- Time is considered **ordered sequence of points** in some **granularity**
  - Use the term **choronon** instead of point to describe minimum granularity
Temporal Database Concepts

Time Representation, … (cont.)

- A *calendar* organizes time into different time units for convenience.
  - Accommodates various calendars
    - Gregorian (western)
    - Chinese
    - Islamic
    - Hindu
    - Jewish
    - Etc.
Temporal Database Concepts

Time Representation, … (cont.)

- **Point events**
  - Single time point event
    - E.g., bank deposit
  - Series of point events can form a time series data

- **Duration events**
  - Associated with specific time period
    - Time period is represented by start time and end time
Temporal Database Concepts

Time Representation, … (cont.)

- **Transaction time**
  - The time when the information from a certain transaction becomes valid

- **Bitemporal database**
  - Databases dealing with two time dimensions
Temporal Database Concepts

Incorporating Time in Relational Databases Using Tuple Versioning

- Add to every tuple
  - Valid start time
  - Valid end time
Temporal Database Concepts

Temporal Database Concepts

Incorporating Time in Object-Oriented Databases Using Attribute Versioning

- A single complex object stores all temporal changes of the object

- **Time varying attribute**
  - An attribute that changes over time
    - E.g., age

- **Non-Time varying attribute**
  - An attribute that does **not** change over time
    - E.g., date of birth
Spatial and Multimedia Databases

- Spatial Database Concepts
- Multimedia Database Concepts
Spatial Databases

Spatial Database Concepts

- Keep track of objects in a multi-dimensional space
  - Maps
  - Geographical Information Systems (GIS)
  - Weather
- In general spatial databases are n-dimensional
  - This discussion is limited to 2-dimensional spatial databases
Spatial Databases

Spatial Database Concepts

- **Typical Spatial Queries**
  - **Range** query: Finds objects of a particular type within a particular distance from a given location
    - E.g., Taco Bells in Pleasanton, CA
  - **Nearest Neighbor** query: Finds objects of a particular type that is nearest to a given location
    - E.g., Nearest Taco Bell from an address in Pleasanton, CA
  - **Spatial joins** or overlays: Joins objects of two types based on some spatial condition (intersecting, overlapping, within certain distance, etc.)
    - E.g., All Taco Bells within 2 miles from I-680.
Spatial Databases

Spatial Database Concepts

- **R-trees**
  - Technique for typical spatial queries
  - Group objects close in spatial proximity on the same leaf nodes of a tree structured index
  - Internal nodes define areas (rectangles) that cover all areas of the rectangles in its subtree.

- **Quad trees**
  - Divide subspaces into equally sized areas
Multimedia Databases

Multimedia Database Concepts

- In the years ahead multimedia information systems are expected to dominate our daily lives.
  - Our houses will be wired for bandwidth to handle interactive multimedia applications.
  - Our high-definition TV/computer workstations will have access to a large number of databases, including digital libraries, image and video databases that will distribute vast amounts of multisource multimedia content.
Multimedia Databases

- Types of multimedia data are available in current systems
  - **Text**: May be formatted or unformatted. For ease of parsing structured documents, standards like SGML and variations such as HTML are being used.
  - **Graphics**: Examples include drawings and illustrations that are encoded using some descriptive standards (e.g. CGM, PICT, postscript).
Multimedia Databases

- Types of multimedia data are available in current systems (cont.)
  - **Images**: Includes drawings, photographs, and so forth, encoded in standard formats such as bitmap, JPEG, and MPEG. Compression is built into JPEG and MPEG.
    - These images are not subdivided into components. Hence querying them by content (e.g., find all images containing circles) is nontrivial.
  - **Animations**: Temporal sequences of image or graphic data.
Multimedia Databases

- Types of multimedia data are available in current systems (cont.)
  - **Video**: A set of temporally sequenced photographic data for presentation at specified rates— for example, 30 frames per second.
  - **Structured audio**: A sequence of audio components comprising note, tone, duration, and so forth.
Multimedia Databases

- Types of multimedia data are available in current systems (cont.)
  - **Audio**: Sample data generated from aural recordings in a string of bits in digitized form. Analog recordings are typically converted into digital form before storage.
Multimedia Databases

- Types of multimedia data are available in current systems (cont.)
  - **Composite** or mixed multimedia data: A combination of multimedia data types such as audio and video which may be physically mixed to yield a new storage format or logically mixed while retaining original types and formats. Composite data also contains additional control information describing how the information should be rendered.
Multimedia Databases

- **Nature of Multimedia Applications:**
  - Multimedia data may be stored, delivered, and utilized in many different ways.
  - Applications may be categorized based on their data management characteristics.
Introduction to Deductive Databases

- Overview of Deductive Databases
- Prolog/Datalog Notation
- Datalog Notation
- Clausal Form and Horn Clauses
- Interpretation of Rules
- Datalog Programs and Their Safety
- Use the Relational Operations
- Evaluation of Non-recursive Datalog Queries
Overview of Deductive Databases

- **Declarative Language**
  - Language to specify rules

- **Inference Engine (Deduction Machine)**
  - Can deduce new facts by interpreting the rules
  - Related to logic programming
    - Prolog language (*Prolog* => *Programming in Logic*)
    - Uses backward chaining to evaluate
      - Top-down application of the rules
Overview of Deductive Databases

- Speciation consists of:
  - Facts
    - Similar to relation specification without the necessity of including attribute names
  - Rules
    - Similar to relational views (virtual relations that are not stored)
Prolog/Datalog Notation

- **Predicate** has
  - a name
  - a fixed number of arguments
    - Convention:
      - Constants are numeric or character strings
      - Variables start with upper case letters
  - E.g., SUPERVISE(Supervisor, Supervisee)
    - States that Supervisor SUPERVISE(s) Supervisee
Prolog/Datalog Notation

- **Rule**
  - Is of the form head :- body
    - where :- is read as if and only iff
  - E.g., SUPERIOR(X,Y) :- SUPERVISE(X,Y)
  - E.g., SUBORDINATE(Y,X) :- SUPERVISE(X,Y)
Prolog/Datalog Notation

- **Query**
  - Involves a predicate symbol followed by some variable arguments to answer the question
  - where `:-` is read as if and only iff
  - E.g., SUPERIOR(james,Y)?
  - E.g., SUBORDINATE(james,X)?
Figure 26.11

- (a) Prolog notation
- (b) Supervisory tree

(a) Facts

SUPERVISE(franklin, john).
SUPERVISE(franklin, ramesh).
SUPERVISE(franklin, joyce).
SUPERVISE(jennifer, alicia).
SUPERVISE(jennifer, ahmad).
SUPERVISE(james, franklin).
SUPERVISE(james, jennifer).
...

(b) Supervisory tree

Rules

SUPERIOR(X, Y) :- SUPERVISE(X, Y).
SUPERIOR(X, Y) :- SUPERVISE(X, Z), SUPERIOR(Z, Y).
SUBORDINATE(X, Y) :- SUPERIOR(Y, X).

Queries

SUPERIOR(james, Y)?
SUPERIOR(james, joyce)?
Datalog Notation

- **Datalog notation**
  - Program is built from **atomic formulae**
    - **Literals** of the form $p(a_1, a_2, \ldots a_n)$ where
      - $p$ predicate name
      - $n$ is the number of arguments
    - Built-in predicates are included
      - E.g., $<$, $<=$, etc.
  - **A literal** is either
    - An atomic formula
    - An atomic formula preceded by not
Clausal Form and Horn Clauses

- A formula can have quantifiers
  - Universal
  - Existential
Clausal Form and Horn Clauses

- In clausal form, a formula must be transformed into another formula with the following characteristics
  - All variables are universally quantified
  - Formula is made of a number of clauses where each clause is made up of literals connected by logical ORs only
  - Clauses themselves are connected by logical ANDs only.
Clausal Form and Horn Clauses

- Any formula can be converted into a clausal form
  - A specialized case of clausal form are horn clauses that can contain no more than one positive literal
- Datalog program are made up of horn clauses
Interpretation of Rules

- There are two main alternatives for interpreting rules:
  - Proof-theoretic
  - Model-theoretic
Interpretation of Rules

**Proof-theoretic**

- Facts and rules are **axioms**
- **Ground axioms** contain no variables
- Rules are **deductive axioms**
- **Deductive axioms** can be used to construct new facts from existing facts
- This process is known as theorem proving
Proving a new fact

Figure 26.12

1. SUPERIOR(X, Y) :- SUPERVISE(X, Y).
2. SUPERIOR(X, Y) :- SUPERVISE(X, Z), SUPERIOR(Z, Y).
3. SUPERVISE(jennifer, ahmad).
4. SUPERVISE(james, jennifer).
5. SUPERIOR(jennifer, ahmad).
6. SUPERIOR(james, ahmad).

(rule 1)
(rule 2)
(ground axiom, given)
(ground axiom, given)
(apply rule 1 on 3)
(apply rule 2 on 4 and 5)
Interpretation of Rules

- **Model-theoretic**
  - Given a finite or infinite domain of constant values, we assign the predicate every combination of values as arguments.
  - If this is done for every predicate, it is called interpretation.
Interpretation of Rules

- **Model**
  - An *interpretation* for a specific set of rules

- **Model-theoretic proofs**
  - Whenever a particular substitution to the variables in the rules is applied, if all the predicated are true under the interpretation, the predicate at the head of the rule must also be true

- **Minimal model**
  - Cannot change any fact from true to false and still get a model for these rules
Minimal model

Rules
SUPERIOR(X, Y) :- SUPERVISE(X, Y).
SUPERIOR(X, Y) :- SUPERVISE(X, Z), SUPERIOR(Z, Y).

Interpretation

Known Facts:
SUPERVISE(franklin, john) is true.
SUPERVISE(franklin, ramesh) is true.
SUPERVISE(franklin, joyce) is true.
SUPERVISE(jennifer, alicia) is true.
SUPERVISE(jennifer, ahmad) is true.
SUPERVISE(james, franklin) is true.
SUPERVISE(james, jennifer) is true.
SUPERVISE(X, Y) is false for all other possible (X, Y) combinations

Derived Facts:
SUPERIOR(franklin, john) is true.
SUPERIOR(franklin, ramesh) is true.
SUPERIOR(franklin, joyce) is true.
SUPERIOR(jennifer, alicia) is true.
SUPERIOR(jennifer, ahmad) is true.
SUPERIOR(james, franklin) is true.
SUPERIOR(james, jennifer) is true.
SUPERIOR(james, john) is true.
SUPERIOR(james, ramesh) is true.
SUPERIOR(james, joyce) is true.
SUPERIOR(james, alicia) is true.
SUPERIOR(james, ahmad) is true.
SUPERIOR(X, Y) is false for all other possible (X, Y) combinations

Figure 26.13
An interpretation that is a minimal model.
Two main methods of defining truth values

- Fact-defined predicates (or relations)
  - Listing all combinations of values that make a predicate true

- Rule-defined predicates (or views)
  - Head (LHS) of 1 or more Datalog rules, for example:

```prolog
SUPERIOR(X, Y) :- SUPERVISE(X, Y).
SUPERIOR(X, Y) :- SUPERVISE(X, Z), SUPERIOR(Z, Y).
SUBORDINATE(X, Y) :- SUPERIOR(Y, X).

SUPERVISOR(X) :- EMPLOYEE(X), SUPERVISE(X, Y).
OVER_40K_EMP(X) :- EMPLOYEE(X), SALARY(X, Y), Y >= 40000.
UNDER_40K_SUPERVISOR(X) :- SUPERVISOR(X), NOT(OVER_40K_EMP(X)).
MAIN_PRODUCTX_EMP(X) :- EMPLOYEE(X), WORKS_ON(X, productx, Y), Y >= 20.
PRESIDENT(X) :- EMPLOYEE(X), NOT(SUPERVISE(Y, X)).
```

Figure 26.15
Rule-defined predicates.
Datalog Programs and Their Safety

- A program is **safe** if it generates a **finite** set of facts
  - Fact-defined predicates (or relations)
    - Listing all combination of values that make a predicate true
  - Rule-defined predicates (or views)
    - Head (LHS) of 1 or more Datalog rules, for example Figure 26.15
Use the Relational Operations

- Many operations of relational algebra can be defined in the form of Datalog rules that define the result of applying these operations on database relations (fact predicates).
  - Relational queries and views can be easily specified in Datalog.
Evaluation of Non-recursive Datalog Queries

- Define an inference mechanism based on relational database query processing concepts
- See Figure 26.17 on predicate dependencies for Figs 26.14 and 26.15
Recap

- Active database & triggers
- Temporal databases
- Spatial and Multimedia databases
- Deductive databases
